Safety detection solutions

XCS safety switches

| | | | |
|--|--|--|--|
| Switch type | XCSR contactless RFID safety switches | | |
| Applications | Highly tamper-proof protection of operators by stopping the machine when the gate is opened (transfer lines, assembly lines, automated equipment, machine tools, etc.). All light industrial machines fitted with access gates with imprecise guidance and/or subjected to frequent washing, shocks and vibrations. This safety switch is suitable for machine with low inertia. | | |
| Design | Rectangular format M12 connector | | |
| Case | Thermoplastic housing (Valox TM) | | |
| Features | Contactless system composed of a microprocessor-controlled switch and a transponder factory-paired with a unique code. Multiposition sensor transponder. | | |
| Assured operating sensing distance (Sao) | 15 mm | | |
| Assured release distance (Sar) | 35 mm | | |
| Type of switch | Standalone RFID switch | Daisy-chain RFID switch for direct series connection | Single RFID switch for point-to-point connection |
| Operating mode | Possible functioning without association with a safety control unit (Integrated External Device Monitoring (EDM) and Start/Restart function) Functioning in combination with a safety control unit PL=e/Cat4 - SIL 3 | | |
| Conformity to standards | Products Machine assemblies RFID protocol | | |
| Product certifications | EN/IEC 60947-5-2, EN/IEC 60947-5-3, UL 508, CSA C22.2 SIL 3 (IEC 61508), SILCL 3 (IEC 62061), PLe-Cat. 4 (EN ISO 13849-1) EN/IEC 60204-1, EN/ISO 14119 Based on ISO 15693 | | |
| Dimensions (w x h x d or Ø) in mm | CE, cULus, TÜV, FCC, EAC, IC, RCM, E2, ECOLAB | | |
| Switch | 30 x 108.3 x 15 | 30 x 118.6 x 5 | 30 x 108.3 x 15 |
| Transponder | 50 x 15 x 15 | | |
| Fixings | Centers | | |
| | Reader | | |
| | Transponder | | |
| 74...78 | 30...34 | | |
| Contact blocks or outputs | Safety output Contact states given in presence of magnet | | |
| | 2 OSSDs (Safety outputs PNP NO). OSSDs are in the ON state when the gate is closed Maximum current 400mA Maximum current 200 mA | | |
| Degree of protection | Conforming to EN/IEC 60529 Conforming to DIN 40050 | | |
| IP 65, IP 66, IP 67 | IP 69K | | |
| Ambient air temperature | For operation For storage | | |

Presentation

Electromechanical detection

Limit switches are used in all automated installations and also in a wide variety of applications, due to the numerous advantages inherent to their technology. They transmit data to the logic processing system regarding:

- presence/absence,
- passing,
- positioning,
- end of travel.

Simplicity of installation, advantages

■ From an electrical viewpoint

- galvanic separation of circuits,
- models suitable for low power switching combined with good electrical durability,
- very good short-circuit withstand in coordination with appropriate fuses,
- total immunity to electromagnetic interference,
- high rated operational voltage.

■ From a mechanical viewpoint

- NC contacts with positive opening operation,
- high resistance to the different ambient conditions encountered in industry (standard tests and specific tests under laboratory conditions),
- high repeat accuracy, up to 0.01 mm on the tripping points.

Detection movements

- Linear movement (plunger)
- Rotary movement (lever)
- Multi-directional movement

Terminology

| | |
|-----------------------------------|---|
| Rated value of a quantity | <ul style="list-style-type: none"> ■ This replaces the term “nominal value”. ■ It is the fixed value for a specific function. |
| Utilisation categories: | <ul style="list-style-type: none"> ■ AC-15 replaces AC-11: control of an electromagnet on AC, test 10 Ie/Ie. ■ AC-12: control of a resistive load on AC or static load isolated by opto-coupler. ■ DC-13 replaces DC-11: control of an electromagnet on DC, test Ie/Ie. |
| Positive opening travel | ■ Minimum travel from the initial movement of contact actuator to the position required to accomplish positive opening operation. |
| Positive opening force | ■ The force required on the contact actuator to accomplish positive opening operation. |
| Switching capacity | <ul style="list-style-type: none"> ■ I_{th} is no longer a rated value but a conventional current used for heating tests. Example: for category A300 the corresponding operational current, I_e maximum, is 6 A-120 V or 3 A-240 V, the equivalent I_{th} being 10 A. |
| Positive opening operation | <ul style="list-style-type: none"> ■ A limit switch complies to this specification when all the closed contact elements of the switch can be changed, with certainty, to the open position (no flexible link between the moving contacts and the operator of the switch, to which an actuating force is applied). ■ All limit switches incorporating either a slow break contact block or a snap action NC + NO (form Zb), NC + NO + NO, NC + NC + NO, NC + NC + NO + NO contact block are positive opening operation, in complete conformity with standard IEC 60947-5-1 Appendix K. |

Contact blocks

Snap action contacts

- Snap action contacts are characterised by different tripping and reset points (differential travel).
- The displacement speed of the moving contacts is not related to the speed of the operator.
- This feature ensures satisfactory electrical performance in applications involving low speed actuators.

Unactuated state Approach travel Contact change of state Positive opening

Slow break contacts

- Slow break contacts are characterised by identical tripping and resetting points.
 - The displacement speed of the moving contacts is equal, or proportional, to the speed of the operator (which must not be less than 0.1 m/s = 6 m/minute).
- The opening distance is also dependent on the distance travelled by the operator.

Electrical durability for normal loads

- Normally, for inductive loads, the current value is less than 0.1 A (sealed), i.e. values of 3 to 40 VA sealed and 30 to 1000 VA inrush, depending on the voltage.

For this type of application the electrical durability will exceed 10 million operating cycles.

Application example: XCKJ161 + LC1D12●●● (7 VA sealed, 70 VA inrush).

Electrical durability = 10 million operating cycles.

Switching capacity

- 1 Normal industrial PLC input type 1 (PLC: industrial programmable logic controllers)
- 2 Normal industrial PLC input type 2

3 Switching capacity conforming to IEC 60947-5-5, utilisation category AC-15, DC-13

| | | | | | |
|------|-------|-----|------|-------|-------|
| A300 | 240 V | 3 A | B300 | 240 V | 1.5 A |
|------|-------|-----|------|-------|-------|

| | | | | | |
|------|-------|--------|------|-------|--------|
| Q300 | 250 V | 0.27 A | R300 | 250 V | 0.13 A |
|------|-------|--------|------|-------|--------|

4 Switching capacity conforming to IEC 60947-5-1, utilisation category AC-15, DC-13

| | | | | | |
|------|-------|-----|------|-------|-----|
| A300 | 120 V | 6 A | B300 | 120 V | 3 A |
|------|-------|-----|------|-------|-----|

| | | | | | |
|------|-------|--------|------|-------|--------|
| Q300 | 125 V | 0.55 A | R300 | 125 V | 0.27 A |
|------|-------|--------|------|-------|--------|

Electrical durability for small loads

- The use of limit switches with programmable controllers is becoming more common.

- With small loads, limit switches offer the following levels of reliability:

- failure rate of less than 1 for 100 million operating cycles using snap action contacts (contacts XE2SP),
- failure rate of less than 1 for 20 million operating cycles using slow break contacts (contacts XE●NP and XE3SP).
- failure rate of less than 1 for 5 million operating cycles using contacts XCMD.

| | | Range of use |
|--|--|---------------------|
| Standard contacts | XE2SP2151, P3151 | [Blue bar] |
| | XE2NP●●●● | |
| Continuous service (frequent switching) | Contacts of XCMD | [Light blue bar] |
| | XE3●P●●●● | |
| Gold flashed contacts on resistive load | Occasional service Infrequent switching, ≤ 1 operating cycle/ day, and/or corrosive atmosphere | (1) [Dark blue bar] |

(1) Usable up to 48 V/10 mA.

Contact blocks (continued)

Functional diagrams of snap action contacts

■ Example: NC + NO

- A - Maximum travel of operator in millimetres or degrees.
- B - Tripping travel of contact.
- C - Resetting travel of contact.
- D - Differential travel = B - C.
- P - Point from which positive opening is assured.

□ Linear movement (plunger)

- 1 - Resetting point of contact.
- 2 - Tripping point of contact.
- A - Maximum travel of operator in millimetres.
- B - Tripping travel of contact.
- C - Resetting travel of contact.
- D - Differential travel = B - C.
- P - Point from which positive opening is assured.

□ Rotary movement (lever)

- 1 - Resetting point of contact.
- 2 - Tripping point of contact.
- A - Maximum travel of operator in degrees.
- B - Tripping travel of contact.
- C - Resetting travel of contact.
- D - Differential travel = B - C.
- P - Point from which positive opening is assured.

Functional diagrams of slow break contacts

■ Example: NC + NO break before make

- A - Maximum travel of operator in millimetres or degrees.
- B - Tripping and resetting travel of contact 21-22.
- C - Tripping and resetting travel of contact 13-14.
- P - Point from which positive opening is assured.

□ Linear movement (plunger)

- 1 - Tripping and resetting points of contact 21-22.
- 2 - Tripping and resetting points of contact 13-14.
- A - Maximum travel of operator in millimetres.
- B - Tripping and resetting travel of contact 21-22.
- C - Tripping and resetting travel of contact 13-14.
- P - Positive opening point.

□ Rotary movement (lever)

- 1 - Tripping and resetting points of contact 21-22.
- 2 - Tripping and resetting points of contact 13-14.
- A - Maximum travel of operator in degrees.
- B - Tripping and resetting travel of contact 21-22.
- C - Tripping and resetting travel of contact 13-14.
- P - Positive opening point.

Contact blocks (continued)

XE2•P screw clamp terminal connections

XE3•P screw clamp terminal connections

Mounting

Contact connections

- Tightening torque:
 - minimum tightening torque ensuring the nominal characteristics of the contact: 0.8 N.m,
 - maximum tightening torque without damage to the terminals: 1.2 N.m for XE2•P, 1 N.m for XE3•P.
- Connecting cable: cable preparation lengths:
 - for XE2•P, L = 22 mm,
 - for XE2•P3•••, L = 45 mm,

- for XE3•P, L = 14 mm, L1 = 11 mm.

Sweep of connecting cable

- 1 Recommended
- 2 To be avoided

Position of cable gland

- 1 Recommended
- 2 To be avoided

Type of cam

- 1 Recommended
- 2 To be avoided

Mounting and fixing limit switches by the head

- 1 Recommended
- 2 Forbidden

XCKD, XCKP, XCKT, XCMD, XCMH and XCMN

Setting-up

Tightening torque

- The minimum torque is that required to ensure correct operation of the switch.
- The maximum torque is the value which, if exceeded, will damage the switch.

| Range | Item | Torque (N.m) | | Torque (lb-in) | |
|---|--|--------------|------|----------------|-------|
| | | Min. | Max. | Min. | Max. |
| Compact design XCKD, XCKP, XCKT | Cover | 0.8 | 1.2 | 7.08 | 10.62 |

| | Fixing nut for lever on rotary head | 1 | 1.5 | 8.85 | 13.27 |

XCMH, XCMN

(1) 2 spacers supplied with the switch.
(2) 2 screws Ø 4mm (not included).

XCKD, XCKP, XCKT, XCMD, XCMV

- Adjustable in 3 planes:

All the heads can be adjusted in 15° steps throughout 360°, in relation to the body.

All the levers can be adjusted in 15° steps throughout 360°, in relation to the horizontal axis of the head.

XCKJ

- Adjustable throughout 360° in 5° steps, or in 45° steps by reversing the lever or its mounting.

- 1 Reversed $\alpha = 5^\circ$
- 2 Forward $\alpha = 45^\circ$

Specific cams for heads ZCKE09 and ZC2JE09

- 1 0.5 mm min.
- 2 2 mm min.

A = length of lever + 11 mm
ZCKE09: $13 < h < 18$ mm and $B = 12$ mm max.
ZC2JE09: $14 < h < 24$ mm and $B = 6$ mm max.

Reminder of the standards

The majority of Telemecanique Sensors products comply to national standards (for example French NF C standards, German DIN standards), European standards (for example CENELEC) or international standards (for example IEC). These standards rigidly stipulate the characteristic requirements of the designated products (for example IEC 60947 relating to low voltage switchgear and control gear). These products, when correctly used, enable the production of control equipment assemblies, machine control equipment or installations conforming to their own specific standards (for example IEC 60204 for the electrical equipment of industrial machines).

IEC 60947-5-1

Insulation coordination (and dielectric strength)

- The standard IEC 60664 defines 4 categories of prospective transient overvoltages. It is important for the user to select control circuit components which are able to withstand these overvoltages. To these ends, the manufacturer states the rated impulse withstand voltage (U imp) applicable to the product.

Terminal connections

- The cabling capacity, mechanical robustness and durability of the terminals, as well as the ability to resist loosening, are verified by standardised tests.
- Terminal reference marking conforms to standard IEC 60947-5-1 Appendix M.

Switching capacity

- With maximum electrical load. A single designation (A300 for example) enables indication of the contact block characteristics related to its utilisation category.

Positive opening operation (IEC 60947-5-1 Appendix K)

- For contacts used in safety applications (end of travel, emergency stop device, etc.) the assurance of positive opening is required (see IEC 60204, EN 60204) after each test, the opening of the contact being verified by testing with an impulse voltage (2500 V).

Electrical symbols for contacts

- Form Za, the 2 contacts (NO + NC) are the same polarity.

- Form Zb, the 2 contacts (NO + NC) are electrically separate.

Symbol for positive opening

- Simplified version

- Complete symbol

CENELEC EN 50047

The European standards organisation CENELEC, which has 14 member countries, has defined in this standard the first type of limit switch.

It defines 4 variants of devices (forms A, B, C, E).
Limit switches XCKP, XCKD and XCKT conform to standard EN 50047.

- (1) Minimum value
- (2) Maximum value

- A: reference axis
- H: differential travel
- P: tripping point
- E: cable entry

Form A, with roller lever

Form B, with end plunger (rounded)

Form C, with end roller plunger

Form E, with roller lever for 1 direction of actuation

Reminder of the standards (continued)

CENELEC EN 50041

The European standards organisation CENELEC, which has 14 member countries, has defined in this standard the second type of limit switch.

It defines 6 variants of devices (forms A, B, C, D, F, G).
Limit switches XCKJ and XCKS conform to standard EN 50041.

(1) Minimum value
(2) Maximum value

A: reference axis
B: optional elongated holes
H: differential travel
P: tripping point
E: cable entry
Za: tripping zone
Sa: tripping threshold

Form A, with roller lever

Form B, with end plunger (rounded)

Form C, with end roller plunger

Form D, with rod lever

Form F, with side plunger (rounded)

Form G, with side roller plunger

Presentation

Terminology

Mechanical characteristics

T1: bounce time
T: changeover time

Mounting

Electromechanical detection

- XC miniature snap switches, featuring electromechanical technology, assure the following functions:
 - detection of presence or absence,
 - detection of position.

Actuation of the operator (plunger or lever) on the miniature snap switch causes the electrical contact to change state. This information can then be processed by a PLC controlling the installation. XC miniature snap switches can be used both in industrial applications and the building sector.

Features

- XC miniature snap switches incorporate a CO snap action, single break, contact. They are characterised by:
 - high electrical ratings for their very small size,
 - short tripping travel,
 - low tripping force,
 - high repeat accuracy on the tripping points,
 - long service life.

Forces

- Maximum tripping force: maximum force which must be applied to the operator to move it from the rest (unactuated) position to the trip position (tripping point).
- Minimum release force: value to which the force on the operator must be reduced to allow the snap action mechanism to return to its rest (unactuated) position.
- Maximum permissible end of travel force: maximum force that can be applied to the operator at the end of its travel without damaging the switch.

Position/Travel

- 1 **Tripping point:** position of the operator in relation to the switch fixings (fixing hole centre line) at the instant the switch contact changes state.
- A **Differential travel:** distance between the tripping point and the position at which the snap action mechanism returns to its initial state on release of the operator.
- 2 **Overtravel limit:** position of the operator when an extreme force has moved it to the effective end of its available travel.
- B **Overtravel:** distance between the tripping point and the overtravel limit.

The reference point for the figures given for forces and travel is a point F, which is situated on the plunger in the case of a basic switch or at 3 mm from the end of the plain lever in the case of a lever operated switch.

Changeover time

- This is the time taken by the moving contact when moving from one fixed contact to another until it becomes fully stable (contact bounce included).
- This time is related to the inter-contact distance, the mechanical characteristics of the snap action mechanism and the mass of the moving element. However, due to the snap action mechanisms used, the time is largely independent to the speed of operation. It is normally less than 20 milliseconds (including bounce times of less than 5 ms).

Operating speed and maximum usable operating rate

- Our miniature snap switches are suitable for a wide range of operating speeds: generally, from 1 mm/mn to 1 m/s.
- The maximum usable operating rate on a light electrical load may be as high as 10 operations/second.

Mounting and operation

- To conform to the leakage paths and air gaps in standards EEC 24 - EN/IEC 61058 - EN/IEC 60947:
 - an insulation pad must be inserted between the snap switch and the fixing surface if the latter is metal.
 - manual operation of a metal actuator must only be carried out with the aid of an intermediate actuator made of an insulating material.
- The installer must ensure adequate protection against direct contact with the output terminals.

Actuation method

- Direct operation:
 - the plunger should preferably be actuated along its axis. However, the majority of our miniature snap switches will accept skewed operation provided the angle of actuation is not more than 45°.
- The travel of the actuator must not be limited to only reaching the tripping point. The actuator must always be operated in such a manner so that the plunger reaches a point at least 0.5 times the stated overtravel value of the switch. Steps must also be taken to ensure that it does not reach its end of travel nor exceed the maximum permissible end of travel force.

Characteristics (continued)

Actuation method (continued)

- Lever operators
 - when actuation is by a roller lever, force should preferably be applied in the direction shown in the diagrams opposite.
 - where the movements involved are fast, the ramp should be so designed as to ensure that the operator is not subjected to any violent impact or abrupt release.

Fixing - Tightening torque

- The tightening torque of the fixing screws must conform to the following values:

| Ø of fixing screw | | 2 | 2.5 | 3 | 3.5 | 4 |
|--------------------------|---------|----|-----|----|-----|-----|
| Tightening torque (cm.N) | Maximum | 25 | 35 | 60 | 100 | 150 |
| | Minimum | 15 | 25 | 40 | 60 | 100 |

Resistance to mechanical shock and vibration

- Resistance to shock and vibration depends on the mass of the moving parts and on the forces holding the contacts together.
- In general, for a miniature snap switch without accessory:
 - vibration > 10 gn, 10 to 500 Hz,
 - shock > 50 gn, 11 ms 1/2 sine wave.

Electrical characteristics

Operating curves

- These indicate the electrical life of the miniature snap switches under standard conditions (20°C, 1 cycle/2 seconds), by showing the number of switching operations which can be performed with given types of load. For sealed snap switches, the operating rate is 1 cycle/6s.

Insulation resistance

- The insulation resistance of the miniature snap switches is generally greater than 50,000 MΩ, measured at 500 V DC.

Dielectric strength

- The dielectric strength of our miniature snap switches is generally superior to:
 - 1500 Volts between live parts and earth,
 - 1000 Volts between contacts,
 - 600 Volts between contacts for switches with an inter-contact distance less than 0.3 mm.

Operating curves

(1) Miniature snap switches fitted with a lever are supplied with the lever fixed in position B (see page 60). For basic (plunger) snap switches, it is possible to fix the lever in position A, B or C, depending on the required tripping conditions (see page 60).

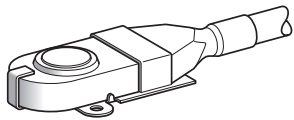

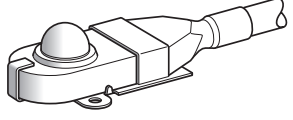

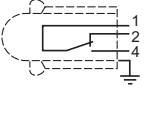

(2) Position of the operator in relation to the switch fixings (fixing hole centre line) at the instant the switch contact changes state.

(1) Manual actuation must be made by an intermediate insulated part, in order to meet basic safety requirements.

One of the two fixing holes must also be used as an earth protection terminal.

(2) Distance between the base of the switch and the top of the plunger at the instant the contact changes state (see dimensions, page 62).

XUF9F●●●

Functions

The overtravel limit switches for power circuit switching are specifically designed to ensure the safety of hoisting equipment.

They directly break the power supply to the hoist motor if the load being handled accidentally exceeds the operating limits of the equipment.

Their mechanism is designed to ensure breakage of the power supply in the event of a malfunction and therefore, an overtravel limit switch cannot be used in place of an end of travel limit switch. It must only be used as a back-up device in the event of failure of the latter, or any other component forming part of an automated control circuit monitoring for excessive overtravel.

Description

XF9D●●● overtravel limit switches are housed in an aluminium alloy case.

XF9F●●● overtravel limit switches are housed in a sheet steel enclosure.

They are equipped with power contacts from Schneider Electric contactors.

Operation

Mounting and operating precautions

It is recommended that the overtravel limit switch be connected as near as possible to the motor, in order to minimise the risk of shunting.

The switch must be positioned in such a manner so as to avoid any damage in the event of the load exceeding the end of travel limits.

In order to ensure positive operation, the operating lever of the overtravel limit switch must be actuated directly by the moving part being monitored. It is essential that the use of any flexible or deformable intermediate actuators be avoided.

Manual reset switches - resetting after tripping

- Before resetting the overtravel limit switch ensure that the cause of its tripping is located and rectified.
- Rotate and hold lever up against end stop.
- Simultaneously press the reset button (XF9D), using accessory included with switch, or operate the reset lever (XF9F) and turn the control station switch away from the trip position.
- Rotate lever back to its initial position.
